The background is a blurred photograph of a tennis court. A player is visible in the lower-left foreground, captured in motion, wearing a dark shirt and light-colored shorts. The court surface is blue, and the surrounding area is green. The overall image has a motion blur effect, suggesting action.

Padel is the sport that has experienced the greatest growth in recent years worldwide. Its progression is geometric, its evolution unstoppable. In this playing field, adidas is the most powerful force driving the sport of padel towards what it already is today, and towards what it will be in the future. By researching, designing, and developing new materials, technologies, and products that adapt more effectively and personalised to each type of player and each style of play.

adidas' innovation aims to improve the power, manoeuvrability, and durability of the rackets. It aims to push further in performance and efficiency. It also aims to take care of the body and health of athletes. But above all, what it seeks is that every player who steps onto the padel court enjoys the sport to the fullest, a sport that is conquering the world.

A male tennis player in a light blue t-shirt and shorts is captured in a dynamic pose, holding a tennis racket. The background is a blurred outdoor setting with a stone wall. The text is overlaid on the image in a white, serif font.

MATERIALS AND TECHNOLOGIES

CRAFTING THE
EXTRAORDINARY

Our specialists research various formats, weights, materials, and technologies until they find unique solutions that make every adidas racket an ideal tool for each type of player.

POWER COMFORT HANDLING

These are the three variables that define the profile and performance of each racket model.

POWER

It's the ability of the racket to maintain the energy provided by the player in a high-speed or high-intensity stroke. A high-power racket is suitable for a player with a high level of technique who seeks to maximise their energy in each stroke.

COMFORT

It's the racket's ability to propel the ball in a stroke of low intensity/speed or without energy from the player. A racket with a high comfort index is suitable for a player who, regardless of their level or playing style, seeks a pleasant sensation with each stroke.

HANDLING

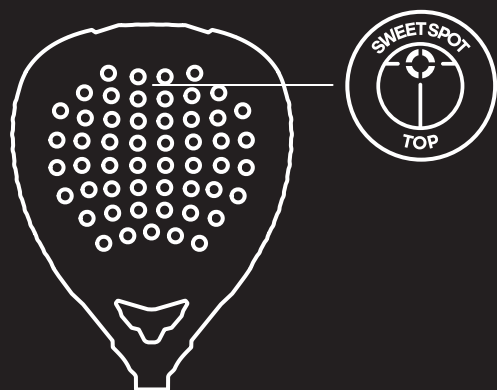

It's the racket's ability to be easily manoeuvred by the player in the gaming environment. Rackets with a high manoeuvrability index require less physical demand. They are suitable for players who want to gain speed and agility in their movements.

The shape is not random or whimsical; it responds to function. The shape determines performance in certain aspects of the game: attack, defence, power, manoeuvrability, comfort...

FORMATS

That's why at adidas, we design rackets with various shapes, ensuring that each player can find the one that perfectly complements their playing style.

DIAMOND

High-balance format that benefits offensive shots. The new Metalbone range now incorporates a new Diamond format. With more weight positioned at the top of the racket, inertia increases, providing amplified power in attacking shots.

DIAMOND OVERSIZE

This format combines a high balance with a larger hitting surface. The inertia created by the increased weight at the top provides more power in offensive shots. The larger hitting surface makes these rackets less demanding and more suitable for a greater number of players.

ROUND

The round format places more weight near the grip, providing the player with greater control in defensive shots, which require more agility in their movements.

ALLROUND

Hybrid format, between Diamond and Round, that optimises the racket's performance in both attacking and defensive shots. Suitable for those players who have not yet defined their style and need good performance in all types of shots.

In this collection, we work with 7 different types of fibres. Each of these fibres has a different degree of flexibility. This allows us, along with the rest of the components (rubber, format and technologies), to evaluate the power and comfort of the rackets. With a less flexible fibre, we achieve more power. The greater the flexibility of the fibre, the greater the ball output and comfort.

FIBERS

In aggressive or high-speed shots, less flexibility allows the ball's rubber to return to its original shape more quickly, resulting in greater speed.

With the racket in a static position or during low-speed shots, greater flexibility allows the racket's rubber to work more and achieve a higher bounce of the ball.

FIBERGLASS

Soft touch, increased comfort, and great ball exit.

Its main characteristic is its elasticity. In slow or baseline shots, it provides a greater ball exit than carbon fiber, as it allows for more flexion and offers greater spring effect. It also allows achieving softer touches for players seeking greater comfort.

FIBERGLASS

CARBON

Power and rigidity, along with exceptional durability.

It provides greater power in quick shots like the smash and offers better control because, being stiffer, the material doesn't absorb the force we apply and eliminates the spring effect. As it is less flexible, the ball exit in slow shots is lower.

CARBON 18K

CARBON 6K

CARBON 3K

CARBON ALUMINIZED

High rigidity and durability taken to the maximum power.

The result of incorporating aluminum into the carbon fiber is a harder touch, ideal for hard-hitting players who prefer this solidity to harness all the force of their arm.

CARBON ALUMINIZED 24K

CARBON ALUMINIZED 16K

CARBON ALUMINIZED 15K

FLEXIBILITY

The rubber is the soul of the racket. That's why it's a key aspect when discussing performance.

Density is the main property of the rubber and defines its memory, meaning the rubber's ability to return to its initial position. Higher density leads to greater power; lower density leads to greater comfort.

RUBBERS

In aggressive or high-speed shots, higher memory will allow the rubber to recover faster and propel the ball at greater speed.

With the racket static or during low-speed shots, lower density allows for more efficient ball pushing and with greater momentum.

At adidas, we work with three EVA rubbers that differentiate the performance of each racket.

SOFT PERFORMANCE

Low-density EVA rubber that provides excellent ball output and comfort in the game. Rackets with this type of rubber are identified by the black cap.

SOFT ENERGY

Intermediate-density EVA rubber that provides exceptional ball output without sacrificing power. Rackets that incorporate this rubber are identified by their blue cap.

HIGH MEMORY

High-density EVA rubber. Increases power in high-speed shots. Suitable for players with higher technical level. Rackets with this rubber are identified by the red cap.

DENSITY

These technologies allow for the more efficient optimization of the player's energy.

POWER

The key aspect when it comes to power is structural rigidity, which prevents the dissipation of the energy applied by the player in each stroke.

EXOSKELETON

Exclusive ADIPOWER. Carbon nerves inserted into the frame and core structure of the racket to increase its stiffness.

DUAL EXOSKELETON

Exclusive ADIPOWER. Evolution of exoskeleton technology. Double-height carbon nerves structure that reinforces the core and frame of the racket to increase resistance to torsion.

NEW

POWER EXTRA GRIP

The longer grip transfers more mass towards the head of the racket and shifts the sweet spot towards the top. This increases inertia and favours power in the shots.

OCTAGONAL STRUCTURE

Exclusive METALBONE. The carbon tubular structure, with a carefully designed octagonal section, reduces torsion to achieve more precise strokes. The eight vertices of the tube provide superior rigidity, ideal for the most aggressive players.

NEW

LOW POLY

Exclusive METALBONE. The polyhedral design of the frame and the heart of the racket provide greater rigidity and power in the strokes.

NEW

DYNAMIC AIRFLOW

Exclusive CROSS IT. This technology allows for a greater airflow in the heart area of the racket during the stroke. The open holes in the bridge create an aerodynamic effect that reduces air resistance and increases the manoeuvrability of the racket.

POWER EMBOSSED RIDGE

Outer carbon nerve located in the frame, which provides greater rigidity to the structure. This technology is incorporated into the most aggressive rackets to enhance shot strength.

STRUCTURAL POWER

An insertion of fibre in the heart of the racket provides greater structural rigidity and enhances power.

NEW

POWER GROOVE

A rail inserted into the edge of the racket increases structural rigidity in the head area and enhances power in the most aggressive strokes.

Spin shots, or shots with spin, are those in which, instead of hitting the ball flat, we impart a rotation to it. That rotational effect, whether it's slice or topspin, will alter the trajectory and behaviour of the ball when it bounces, making it uncomfortable for our opponents.

SPIN SHOTS

Effect technologies allow the player to impart more rotation to the ball thanks to the roughness of the racket face.

SPIN BLADE MOLD

Integrated 3D relief in the racket mold, which provides a better sense of contact and contributes to achieving a higher dose of spin on shots.

SPIN BLADE DECAL

This relief helps improve the sensation of control and increase the amount of spin we can impart to the ball.

SPIN BLADE GRITT

Textured sand relief that helps achieve a better grip on the ball and provides a great sense of control.

SMART HOLES CURVE

This hole arrangement is specially designed to favour the generation of spin in all types of shots.

During play, especially on those more aggressive shots executed with greater power, padel rackets are subjected to significant torsional forces that test their durability.

DURABILITY

Las tecnologías de durabilidad están desarrolladas para reforzar las áreas de la pala sometidas a una mayor torsión.

STRUCTURAL REINFORCEMENT

Perimeter reinforcements that allow for greater resistance to the high torsions the racket must withstand during play.

SMART HOLES LINEAL

The arrangement of the holes, equidistant in groups of three, reinforces the striking surface and improves the durability of the racket.

11 THIRTEEN

Innovative hole distribution pattern on the racket. The eleven holes located in the centre of the striking surface are of a smaller diameter than the remaining thirteen. This provides greater rigidity, power, and durability.

No two matches are the same. Each opponent demands something different from your game: more power in aggressive shots or more comfort in defence. You don't always need the same thing from your racket. That's why we developed the **WEIGHT & BALANCE SYSTEM**.

CUSTOMIZATION

An exclusive adidas technology based on a removable weight system that allows you to customise and adapt your racket to the type of game you want to execute in each match.

HOW DOES WEIGHT & BALANCE SYSTEM WORK?

BALANCE

By placing the weights on the upper part of the racket, the balance will shift towards the top and we will favor attacking shots.

BALANCE

By placing the weights closest to the grip, we will lower the balance, thereby increasing control.

If we remove all the weights, we'll have a lighter racket.

Each racket includes an Allen key keychain to easily perform the operation of placing and removing weights.

EVOLVED

WEIGHT & BALANCE SYSTEM METALBONE

This technology for modifying the weight and balance of the racket is further sophisticated. The new and improved system is based on different weights located on the sides and now also on the top of the racket.

The system consists of two plates (0.6 g each), and on each plate, you can mount 2 washers (0.6 g each) and 2 screws (1.3 g each). This allows for modifying the weight of the racket by a total of 11.2 g.

WEIGHT & BALANCE SYSTEM ADIPOWER

With the ADIPOWER system, you can distribute 7 screws (each weighing 1.3 grams) across 13 possible positions on the edge of the racket: 5 located on each side and 3 on the top.

The various combinations allow for adjusting the racket's weight by a total of 9.1 grams.

WEIGHT & BALANCE SYSTEM ADIPOWER

Customise the weight and balance to your liking. The removable weight system allows you to modify the racket's weight by 9.1 g and adjust the balance to favour power shots or increase control.

CARBON 18K

Power and rigidity, along with exceptional durability.

POWER EMBOSSED RIDGE

Outer carbon nerve located in the frame, providing greater rigidity to the structure.

DUAL EXOSKELETON

Double-height carbon nerve structure reinforcing the core and frame of the racket to increase torsional resistance.

The background of the slide is a dark, almost black, space filled with numerous small, bright red and orange sparks or embers. These sparks are scattered throughout, with a higher concentration in the lower half of the frame, creating a sense of falling fire or a dynamic, energetic atmosphere. The sparks vary in size and brightness, with some appearing as sharp points of light and others as short, glowing streaks.
